1 Read This First

Ultrasound systems and transducers require proper care, cleaning, and handling. Reasonable care includes inspection, cleaning, and disinfection or sterilization, as necessary. This manual contains information and instructions to help you effectively clean, disinfect, and sterilize your Philips ultrasound system and transducers. Additionally, these instructions help avoid damage during cleaning, disinfection, and sterilization, which could void your warranty.

The information in this manual is applicable to the following ultrasound systems:

- Affiniti series
- ClearVue series
- CX30
- CX50
- EPIQ series
- HD5
- HD6
- HD7
- HD11 series
- HD15
- iE33
- iU22
- Lumify
- Sparq
- Xperius (distributed by B. Braun)

For information about Philips ultrasound systems or transducers that are not specifically mentioned in this document, see your system's User Manual, which contains information that is specific to your system and transducers.
Before you attempt to clean or disinfect a system or its transducers, read this manual and strictly observe all warnings and cautions. Pay special attention to the information in the “Safety” section.

For a list of disinfectants and cleaners that are compatible with your Philips ultrasound system and transducers, see Disinfectants and Cleaning Solutions for Ultrasound Systems and Transducers (available with your system documentation) or the "Transducer and System Care" website:

www.philips.com/transducercare

For a list of the transducers supported by your system, see your system User Manual, which contains information that is specific to your system and transducers.

For more information:

- In North America, call Philips at 800-722-9377.
- Outside North America, contact your local Philips representative.
- Visit the "Transducer and System Care" website:
  www.philips.com/transducercare

This document and the information contained in it is proprietary and confidential information of Philips Healthcare ("Philips") and may not be reproduced, copied in whole or in part, adapted, modified, disclosed to others, or disseminated without the prior written permission of the Philips Legal Department. This document is intended to be used either by customers, and is licensed to them as part of their Philips equipment purchase, or to meet regulatory commitments as required by the FDA under 21 CFR 1020.30 (and any amendments to it) and other local regulatory requirements. Use of this document by unauthorized persons is strictly prohibited.

### Warning Symbols

The system may use the following warning symbols. For additional symbols used on the system, see the "Safety" section in your system User Manual.

**Warning Symbols**

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>![Warning Symbol]</td>
<td>Identifies a caution.</td>
</tr>
<tr>
<td>![Dangerous Voltage Symbol]</td>
<td>Dangerous voltages: Appears adjacent to high-voltage terminals, indicating the presence of voltages greater than 1,000 Vac (600 Vac in the United States).</td>
</tr>
<tr>
<td>![ESD Sensitivity Symbol]</td>
<td>Identifies ESD (electrostatic-discharge) sensitivity of a connector that is not tested as specified in IEC 60601-1-2. Do not touch exposed connector pins. Touching exposed pins can cause electrostatic discharge, which can damage the product.</td>
</tr>
<tr>
<td>![Information Symbol]</td>
<td>Indicates that the user should see the instructions for use for safety information.</td>
</tr>
</tbody>
</table>

### Customer Comments

If you have questions about the user information, or you discover an error in the user information, in the USA, please call Philips at 800-722-9377; outside the USA, please call your local Philips customer service representative.
Customer Service

Customer service representatives are available worldwide to answer questions and to provide maintenance and service. Please contact your local Philips representative for assistance. You can also contact the following office for referral to a customer service representative, or visit the Philips Healthcare "Contact Us" website:

www.healthcare.philips.com/main/about/officelocator/index.wpd

Philips Ultrasound, Inc.
22100 Bothell Everett Hwy, Bothell, WA 98021-8431, USA
800-722-9377

User Information Conventions

The user information for your product uses the following typographical conventions to assist you in finding and understanding information:

- All procedures are numbered, and all subprocedures are lettered. You must complete steps in the sequence they are presented to ensure success.
- Bulleted lists indicate general information about a particular function or procedure. They do not imply a sequential procedure.
- The left side of the system is to your left as you stand in front of the system, facing the system. The front of the system is nearest to you as you operate it.
- Transducers and pencil probes both are referred to as transducers, unless the distinction is important to the meaning of the text.

Information that is essential for the safe and effective use of your product appears throughout your user information as follows:
Supplies and Accessories

For information on ordering supplies and accessories, see your system User Manual.
2 Safety

Read the information included in this section to ensure the safety of all persons operating and maintaining ultrasound equipment, all patients participating in exams, and to ensure the quality of the system and its accessories.

Safety information that applies only to a specific cleaning or disinfection task is included in the procedure for that task.

Warnings and Cautions

For maximum safety when using cleaners and disinfectants, observe the following warnings and cautions:

**WARNING**

Disinfectants are recommended because of their chemical compatibility with product materials, not their biological effectiveness. For the biological effectiveness of a disinfectant, see the guidelines and recommendations of the disinfectant manufacturer, the U.S. Food and Drug Administration, and the U.S. Centers for Disease Control.

**WARNING**

The level of disinfection required for a device is dictated by the type of tissue it will contact during use and the type of transducer being used. Ensure that the disinfectant type is appropriate for the type of transducer and the transducer application. For information on the levels of disinfection requirements, see “Transducer Care Methods” on page 31. Also, see the disinfectant label instructions and the recommendations of the Association for Professionals in Infection Control, the U.S. Food and Drug Administration, and the U.S. Centers for Disease Control.
WARNING
When sterilizing a transducer, ensure that the sterilant's strength and duration of contact are appropriate for sterilization. Be sure to follow the manufacturer's instructions.

WARNING
If a pre-mixed solution is used, be sure to observe the solution expiration date.

WARNING
Follow the recommendations of the disinfectant manufacturer.

WARNING
To avoid risk of electrical shock, do not use any transducer that has been immersed beyond the specified cleaning or disinfection level.

CAUTION
Do not use abrasive cleaners, or acetone, MEK, paint thinner, or other strong solvents on the system, peripherals, or transducers.

CAUTION
Do not use Sani-Cloth AF3 or Super Sani-Cloth to disinfect the system.
CAUTION
On display screens, do not use glass cleaners or products containing bleach. Immediately wipe away disinfectants or cleaners to prevent residue buildup.

CAUTION
On display screens, use microfiber cloth; do not use paper towels.

CAUTION
System surfaces and transducers are resistant to ultrasound gel, alcohol, and disinfectants, but if you use those substances, you must wipe them off to prevent permanent damage.

CAUTION
Using non-recommended disinfectants, using incorrect solution strengths, or immersing a transducer deeper or longer than recommended can damage or discolor the transducer and voids the transducer warranty.
CAUTION

On transducers with USB connectors, the only parts that may be cleaned with isopropyl alcohol are the transducer housing and lens (acoustic window). On non-TEE transducers, the only parts that may be cleaned with isopropyl alcohol are the connector housing and the transducer housing and lens. On TEE transducers, the only parts that may be cleaned with isopropyl alcohol are the connector housing and the control housing. Ensure that the solution is only 70% alcohol or less. Do not clean any other part of a transducer with isopropyl alcohol (including cables, USB connectors, or strain reliefs), as it can damage those parts of the transducer. This damage is not covered by the warranty or your service contract.

CAUTION

Some cleaning and disinfectant products may result in discoloration if residual disinfectant and gel have not been completely removed between each use. Always remove gel completely before using cleaners and disinfectants. If necessary, where compatible for use, 70% isopropyl alcohol may be used to remove residue buildup on system and transducer components.

Latex Product Alert

Philips ultrasound systems and transducers do not contain natural rubber latex that contacts humans.

WARNING

Transducer covers can contain natural rubber latex, which may cause allergic reactions in some individuals.
WARNING
The M2203A bite guard strap contains natural rubber latex, which may cause allergic reactions.

FDA Medical Alert on Latex
March 29, 1991, Allergic Reactions to Latex-Containing Medical Devices

Because of reports of severe allergic reactions to medical devices containing latex (natural rubber), the FDA is advising health care professionals to identify their latex sensitive patients and be prepared to treat allergic reactions promptly. Patient reactions to latex have ranged from contact urticaria to systemic anaphylaxis. Latex is a component of many medical devices, including surgical and examination gloves, catheters, intubation tubes, anesthesia masks, and dental dams.

Reports to the FDA of allergic reactions to latex-containing medical devices have increased lately. One brand of latex cuffed enema tips was recently recalled after several patients died as a result of anaphylactoid reactions during barium enema procedures. More reports of latex sensitivity have also been found in the medical literature. Repeated exposure to latex both in medical devices and in other consumer products may be part of the reason that the prevalence of latex sensitivity appears to be increasing. For example, it has been reported that 6% to 7% of surgical personnel and 18% to 40% of spina bifida patients are latex sensitive.

Proteins in the latex itself appear to be the primary source of the allergic reactions. Although it is not now known how much protein is likely to cause severe reactions, the FDA is working with manufacturers of latex-containing medical devices to make protein levels in their products as low as possible.

FDA’s recommendations to health professionals in regard to this problem are as follows:

- When taking general histories of patients, include questions about latex sensitivity. For surgical and radiology patients, spina bifida patients and health care workers, this recommendation is especially important. Questions about itching, rash or wheezing after wearing latex gloves or inflating a toy balloon may be useful. Patients with positive histories should have their charts flagged.
• If latex sensitivity is suspected, consider using devices made with alternative materials, such as plastic. For example, a health professional could wear a non-latex glove over the latex glove if the patient is sensitive. If both the health professional and the patient are sensitive, a latex middle glove could be used. (Latex gloves labeled “Hypoallergenic” may not always prevent adverse reactions.)

• Whenever latex-containing medical devices are used, especially when the latex comes in contact with mucous membranes, be alert to the possibility of an allergic reaction.

• If an allergic reaction does occur and latex is suspected, advise the patient of a possible latex sensitivity and consider an immunologic evaluation.

• Advise the patient to tell health professionals and emergency personnel about any known latex sensitivity before undergoing medical procedures. Consider advising patients with severe latex sensitivity to wear a medical identification bracelet.

The FDA is asking health professionals to report incidents of adverse reactions to latex or other materials used in medical devices. (See the October 1990 FDA Drug Bulletin.) To report an incident, contact the FDA Problem Reporting Program, MedWatch, at 1-800-332-1088, or on the Internet:

www.fda.gov/Safety/MedWatch/

For a single copy of a reference list on latex sensitivity, write to: LATEX, FDA, HFZ-220, Rockville, MD 20857.

Infection Control

Issues related to infection control affect the operator and the patient. Follow the infection-control procedures established in your facility for the protection of both the staff and the patient.
Handling Contaminated Transducers

The primary area of concern is the handling of transducers that have contacted infected patients. Always wear gloves when you handle transducers used in TEE, endocavity, intraoperative, and biopsy procedures that have not been previously disinfected. For information on cleaning and disinfecting transducers, see the “Transducer Care” section.

Removing Blood and Infectious Material from the System

WARNING

If the system becomes contaminated internally with bodily fluids carrying pathogens, you must immediately notify your Philips service representative. Components inside the system cannot be disinfected. In that case, the system must be disposed of as biohazardous material in accordance with local or federal laws.

CAUTION

On transducers with USB connectors, the only parts that may be cleaned with isopropyl alcohol are the transducer housing and lens (acoustic window). On non-TEE transducers, the only parts that may be cleaned with isopropyl alcohol are the connector housing and the transducer housing and lens. On TEE transducers, the only parts that may be cleaned with isopropyl alcohol are the connector housing and the control housing. Ensure that the solution is only 70% alcohol or less. Do not clean any other part of a transducer with isopropyl alcohol (including cables, USB connectors, or strain reliefs), as it can damage those parts of the transducer. This damage is not covered by the warranty or your service contract.

Use a gauze pad moistened with soap and water to remove blood on the system and the transducer connectors and cables. Then dry the equipment with a soft cloth to prevent corrosion. You can use a 70% solution of isopropyl alcohol only on certain parts of the system and certain parts of some transducers. Additional cleaning agents are available. For more
information, see *Disinfectants and Cleaning Solutions for Ultrasound Systems and Transducers*. For more information about removing blood and other infectious material from the system, see the “System Cleaning and Maintenance” section.

**EGC Cables and Lead Sets**

For information on cleaning ECG cables and lead sets, see the “System Cleaning and Maintenance” section.

---

**Transmissible Spongiform Encephalopathy**

**WARNING**

If a sterile transducer cover becomes compromised during an intraoperative application involving a patient with transmissible spongiform encephalopathy, such as Creutzfeldt-Jakob disease, follow the guidelines of the U.S. Centers for Disease Control and this document from the World Health Organization: WHO/CDS/APH/2000/3, WHO Infection Control Guidelines for Transmissible Spongiform Encephalopathies. The transducers for your system cannot be decontaminated using a heat process.

**Transducer Covers**

To prevent contamination by blood-borne pathogens, sterile transducer covers are required for needle guidance procedures. Philips and B. Braun recommend the use of qualified covers.

For procedures for using transducer covers, see the instructions provided with the covers.
**WARNING**

Latex and talc are commonly used in sheaths marketed to help with infection control in transesophageal, endocavity, and intraoperative imaging applications and during needle guidance and biopsies. Examine the packaging to confirm latex and talc content. Studies have shown that patients can experience allergic reactions with natural rubber latex. See the FDA Medical Alert, March 29, 1991, reprinted in “FDA Medical Alert on Latex” on page 15.

**WARNING**

In intraoperative applications, sterilized transducers should be used with sterile gel and a sterile transducer cover.

**WARNING**

Inspect transducer covers before and after use.

**WARNING**

Do not apply the transducer cover until you are ready to perform the procedure.

**WARNING**

If an installed transducer cover is cut or contaminated before use, the transducer should be cleaned and disinfected, and a new sterile cover installed.
WARNING
Sterile transducer covers are disposable and must not be reused.
3 System Cleaning and Maintenance

Maintenance should be performed regularly and as needed.

Because the system is a piece of medical equipment that contains several circuit boards, extensive service diagnostics, and complex operating software, Philips recommends that only trained personnel service the system.

It is important to clean and maintain the ultrasound system and peripherals. Thorough cleaning is important for pieces of peripheral equipment, because they contain electromechanical devices. If exposed to constant and excessive environmental dust and humidity, these devices will suffer in both performance and reliability.

It is essential to clean the transducers used with your ultrasound system. The cleaning procedures vary for the different types of transducers and their uses. For detailed instructions on how to clean and maintain each type of transducer used with the system, see the “Transducer Care” section.

WARNING

Always use protective eyewear and gloves when cleaning, disinfecting, or sterilizing any equipment.

CAUTION

Follow all instructions provided to avoid damage during cleaning, disinfection, and sterilization. Failure to do so could void your warranty.

Disinfectants and Cleaners for System Surfaces

This information applies to all systems except for Lumify, which is covered under “Lumify System Maintenance” on page 27.
The compatibility of disinfectants and cleaners varies depending on the item on which they are used. The products in the following table are compatible with these system surfaces:

- External plastic and painted surfaces of system and cart
- System control panel
- ECG trunk cables, leads, and electrodes
- Touch screens and monitor screens
- Easy-clip transducer cable managers

<table>
<thead>
<tr>
<th>Cleaning Solutions for All Surfaces</th>

<td>Sani-Cloth Plus (QUAT/IPA based)</td>
</tr>
</tbody>
</table>

¹. Mild soap solutions do not contain any harsh ingredients and are not irritating to the skin. They must not contain fragrance, oils, or alcohols. Hand sanitizers are not approved for use.

**CAUTION**

Do not use abrasive cleaners, or acetone, MEK, paint thinner, or other strong solvents on the system, peripherals, or transducers.
CAUTION
Do not use Sani-Cloth AF3 or Super Sani-Cloth to disinfect the system.

CAUTION
On display screens, do not use glass cleaners or products containing bleach. Immediately wipe away disinfectants or cleaners to prevent residue buildup.

CAUTION
Do not spill or spray liquid into any system seams, ports, or transducer receptacles.

CAUTION
On display screens, use microfiber cloth; do not use paper towels.

CAUTION
System surfaces and transducers are resistant to ultrasound gel, alcohol, and disinfectants, but if you use those substances, you must wipe them off to prevent permanent damage.

For a more information about disinfectants for the system and transducers, see the “Disinfectants for Systems and Transducers” section.

For instructions on cleaning and disinfecting ultrasound systems and transducers, see the “Transducer Care” section.
Cleaning and Disinfecting the System and ECG Equipment

This information applies to all systems except for Lumify, which is covered under “Lumify System Maintenance” on page 27.

The system control panel and other outer surfaces are most likely to be affected by liquid spills and other materials such as excessive amounts of gel. These materials may seep into electrical components under the panel and cause intermittent failures. During preventive maintenance, look for potential problems including loose knobs and worn controls.

WARNING
Always use protective eyewear and gloves when cleaning, disinfecting, or sterilizing any equipment.

WARNING
Before performing any system maintenance or cleaning, always turn off the system and disconnect it from the power source.

CAUTION
Ensure that the system brakes are locked before performing maintenance or cleaning.

CAUTION
Use only compatible cleaners and disinfectants on system surfaces. If a pre-mixed solution is used, be sure to observe the solution expiration date.
CAUTION
Do not use abrasive cleaners, or acetone, MEK, paint thinner, or other strong solvents on the system, peripherals, or transducers.

CAUTION
On display screens, do not use cleaners containing bleach. It may damage the surfaces.

CAUTION
On display screens, use microfiber cloth; do not use paper towels.

CAUTION
Do not touch display screens with sharp objects. Take care not to scratch the face of display screens while cleaning.

CAUTION
When cleaning the system control panel, display screens, and keyboard, take care not to get any solution inside the housings. Do not spill or spray liquid on the controls, into the system cabinet, or into the transducer receptacles.
CAUTION

Do not spray disinfectant directly on system surfaces. When wiping, do not allow disinfectant to pool or run on system surfaces. In either case, disinfectant may leak into the system, damaging the system and voiding the warranty. Wipe only with a cloth or applicator that is lightly dampened.

CAUTION

If you use an isopropyl alcohol solution for disinfection, ensure that the solution is only 70% alcohol or less. Solutions of more than 70% alcohol can cause product damage.

Cleaning the System and ECG Equipment

This information applies to all systems except for Lumify, which is covered under “Lumify System Maintenance” on page 27.

1. Before cleaning, turn off the system, disconnect the power cord from the power source, and ensure that the system brakes are locked.

2. To clean display screens:
   a. Remove dust with a soft, lint-free cloth. Philips recommends using a microfiber cloth.
   b. Use a liquid screen cleaner specifically designed for LCDs. Spray the liquid onto the cleaning cloth and wipe the screen clean. You can also use pre-moistened screen wipes.
   c. Dry the screen with a soft, lint-free cloth.

3. To clean the control panel, remove any solid matter around the keys or the controls with a cotton swab or toothpick to ensure that solids are not pushed into the cabinet. Wipe with a soft cloth moistened with soap and water.

4. Wipe the remaining external surfaces of the system and the cart with a soft cloth moistened with soap and water:
   • Painted and plastic surfaces
   • ECG trunk cables, leads, and electrodes
You may use a 70% isopropyl alcohol solution for stubborn stains or inks, and then wash with soap and water.

5. Remove any residue with a cloth moistened with purified water.

6. Dry the equipment to prevent potential corrosion.

If the equipment has come in contact with blood or infectious material, see “Disinfecting System Surfaces and ECG Equipment” on page 27 and “Infection Control” on page 16.

**Disinfecting System Surfaces and ECG Equipment**

Before disinfecting the system and ECG equipment, read “Disinfectants and Cleaners for System Surfaces” on page 21.

This information applies to all systems except for Lumify, which is covered under “Lumify System Maintenance” on page 27.

1. Before cleaning and disinfecting, turn off the system, disconnect the power cord from the power source, and ensure that the system brakes are locked.

2. Clean the system according to the procedures in “Cleaning the System and ECG Equipment” on page 26.

3. Choose a disinfectant compatible with your system and follow the label instructions for preparation, temperature, and solution strength. If a pre-mixed solution is used, be sure to observe the solution expiration date.

4. Wipe system surfaces with the disinfectant, following disinfectant label instructions for wipe durations, solution strengths, and disinfectant contact duration. Ensure the solution strength and duration of contact are appropriate for the intended clinical application.

5. Dry the equipment to prevent potential corrosion.

**Lumify System Maintenance**

It is your responsibility to appropriately clean and disinfect your Lumify-compatible smart device in accordance with the device manufacturer's instructions and with your institution's policies for cleaning and disinfecting of medical devices.
WARNING
If the Lumify-compatible smart device becomes contaminated internally with bodily fluids containing pathogens, you must immediately notify your Philips service representative. Components inside the device cannot be disinfected. In that case, the device must be disposed of as biohazardous material in accordance with local or federal laws.

Cleaning the Trackball
Cleaning the trackball regularly prolongs its useful life and prevents service calls.
1. With your fingers, unscrew the ring around the trackball.
2. Lift the trackball out of the mounting area.
3. Clean the trackball and the mounting area with a lint-free cloth or a small brush.
4. Place the ball back on the mounting area.
5. With your fingers, screw the ring back on.

Cleaning the System Air Filter
The system air filter should be inspected weekly and cleaned as needed. If you decide to clean the air filter with soap and water, you may want to install a spare filter while the other filter is drying. To order additional air filters, call Philips at 800-722-9377 (North America) or your local Philips Ultrasound representative (outside North America).

WARNING
Before performing any system maintenance or cleaning, always turn off the system and disconnect it from the power source.
CAUTION
Turn off power before you remove the air filter. Do not turn on power without the air filter installed.

CAUTION
Ensure that the air filter is dry before installing it. Installing a wet or damp air filter can damage the system.

CAUTION
Ensure that the system brakes are locked before you clean the air filter.

1. Locate the air filter handle.
2. Pull the air filter handle straight out, until the filter is completely removed from the system.
3. Inspect the filter. Depending on the condition of the air filter, vacuum or rinse the filter with water to clean it. If the filter is worn out, or cannot be cleaned, replace it with a spare.
4. To reinstall the filter, slide the filter into place.
5. For additional system-specific procedures, such as resetting the filter maintenance status, see your system User Manual.
Cleaning and Disinfecting the AC Adapter

CAUTION
Do not immerse the AC adapter.

CAUTION
Keep moisture and liquid away from the AC adapter. Do not spill or spray liquid on the adapter.

1. Before cleaning the AC adapter, disconnect it from the system and the wall outlet.
2. Wipe the AC adapter with a dry cloth. If spot cleaning is necessary, wipe with a cloth dampened with soap and water.
3. Remove any solid matter with a cotton swab or toothpick to ensure that solids are not pushed into the adapter.
4. If disinfection is necessary, wipe with an alcohol-moistened towelette or cloth.
5. Wipe the AC adapter with a dry cloth until thoroughly dry before connecting it into the system or wall outlet.
4 Transducer Care

All Philips transducers require proper care, cleaning, and handling. This section contains information and instructions to help you effectively clean, disinfect, and sterilize the transducers that are compatible with your Philips ultrasound system. Additionally, these instructions help avoid damage during cleaning, disinfection, and sterilization, which could void your warranty.

Reasonable care includes inspection, cleaning, and disinfection or sterilization, as necessary. Transducers must be cleaned after each use. Inspect all parts of the transducer carefully before each use. Check for cracks or other damage that jeopardizes the integrity of the transducer. Report any damage to your Philips representative, and discontinue use of the transducer.

For information on the gels that are compatible with your system's transducers, see “Ultrasound Transmission Gels” on page 83.

Transducer Care Methods

To choose an appropriate care method for your transducer, you first must determine the classification of the transducer, based on its use. The care method for your transducer determines the appropriate disinfectant for your transducer. For details about compatible disinfectants, see the “Disinfectants for Systems and Transducers” section. Always follow the manufacturer’s instructions when using cleaners and disinfectants.

NOTE

Philips recommends the same level of cleaning, disinfection, and sterilization between uses, regardless of whether the next use is on the same patient or a different patient.

1. High-level disinfection and the use of a sterile gel and a transducer cover, as described in the instructions provided with the transducer cover, is an accepted method of infection control for ultrasound transducers. See the FDA Guidance document “Information for Manufacturers Seeking Marketing Clearance of Diagnostic Ultrasound Systems and Transducers,” updated September 9, 2008, at the following website:

---

### Non-TEE Transducer Care

This information applies to all non-TEE transducers except those with USB connectors. For instructions for USB transducers, see “USB Transducer Care” on page 52.

The following topics explain how to clean, disinfect, and sterilize non-TEE transducers. See “Transducer Care Methods” on page 31 to determine the appropriate care method for your transducer. The following figure identifies the components of non-TEE transducers.
### Non-TEE Transducer Components

Warnings and Cautions for Non-TEE Transducers

Observe the following warnings and cautions during all cleaning, disinfection, and sterilization procedures, and when using disinfectants. More specific warnings and cautions are included within the care and cleaning procedures and on the labels of the cleaners or disinfectants.

**WARNING**

Transducers must be cleaned after each use. Cleaning the transducer is an essential step before effective disinfection or sterilization. Be sure to follow the manufacturer’s instructions when using disinfectants.

**WARNING**

Always use protective eyewear and gloves when cleaning, disinfecting, or sterilizing any equipment.

**WARNING**

Sterile transducer covers with sterile ultrasound transmission gel are required for intraoperative and biopsy procedures. Protective covers are recommended for transrectal and intravaginal procedures; in China and Japan, the covers are mandatory. Philips recommends the use of qualified covers.

**WARNING**

Sterile transducer covers are disposable and must not be reused.
WARNING
In intraoperative applications (other than TEE or endoscopy), transducers used with sterile gel and sterile transducer covers may use either the high-level disinfection or sterilization care method.

WARNING
Disinfectants are recommended because of their chemical compatibility with product materials, not their biological effectiveness. For the biological effectiveness of a disinfectant, see the guidelines and recommendations of the disinfectant manufacturer, the U.S. Food and Drug Administration, and the U.S. Centers for Disease Control.

WARNING
The level of disinfection required for a device is dictated by the type of tissue it will contact during use and the type of transducer being used. Ensure that the disinfectant type is appropriate for the type of transducer and the transducer application. For information on the levels of disinfection requirements, see “Transducer Care Methods” on page 31. Also, see the disinfectant label instructions and the recommendations of the Association for Professionals in Infection Control, the U.S. Food and Drug Administration, and the U.S. Centers for Disease Control.

WARNING
When sterilizing a transducer, ensure that the sterilant's strength and duration of contact are appropriate for sterilization. Be sure to follow the manufacturer's instructions.
WARNING
If a pre-mixed solution is used, be sure to observe the solution expiration date.

WARNING
Follow the recommendations of the disinfectant manufacturer.

CAUTION
Using non-recommended disinfectants, using incorrect solution strengths, or immersing a transducer deeper or longer than recommended can damage or discolor the transducer and voids the transducer warranty.

CAUTION
On non-TEE transducers, the only parts that may be cleaned with isopropyl alcohol are the connector housing and the transducer housing and lens (acoustic window). Ensure that the solution is only 70% alcohol or less. Do not clean any other part of a transducer with isopropyl alcohol (including cables or strain reliefs), as it can damage those parts of the transducer. This damage is not covered by the warranty or your service contract.
Alcohol-Compatible Non-TEE Transducer Parts

1. The only parts that may be cleaned with 70% isopropyl alcohol solutions are the connector housing and transducer housing and lens. Do not allow fluid to enter any unsealed area of the transducer. When cleaning the lens surface, use a gentle wiping or blotting motion. Aggressive wiping or scrubbing can damage the lens.

**CAUTION**

When using an enzymatic cleaner, be sure to use the proper concentration and rinse thoroughly. Enzymatic cleaners are generically compatible for use.

**CAUTION**

Attempting to clean or disinfect a transducer, cable, or connector housing by using a method other than the procedures here can damage the device and voids the warranty.

**CAUTION**

Do not allow sharp objects, such as scissors, scalpels, or cauterizing knives, to touch transducers or cables.
CAUTION
When handling a transducer, do not bump the transducer on hard surfaces.

CAUTION
Do not use a surgeon's brush when cleaning transducers. Even the use of soft brushes can damage transducers.

CAUTION
Do not use a brush on the connector housing label.

CAUTION
Do not use paper products or abrasive products when cleaning a transducer. They damage the soft lens (acoustic window) of the transducer. The use of abrasive industrial wipes such as Wypall X60 can damage the lens.

CAUTION
During cleaning, disinfection, and sterilization, orient the parts of the transducer, connector housing, or cable that must remain dry higher than the wet parts, until all parts are dry. This helps keep liquid from entering unsealed areas of the transducer.
CAUTION

When cleaning and disinfecting transducers, do not allow any fluid to enter the connector through the electrical contacts, strain reliefs, connector housing, or areas surrounding the locking lever shaft. On TEE transducers, do not allow any fluid to enter the handle or steering mechanism. When wiping or spraying connector or handle housings, wipe or spray only the outer surfaces. If available, place a connector-cover splash guard over the electrical contacts to help prevent fluid from entering the connector housing. Damage due to fluids in these areas is not covered by the warranty or your service contract.

CAUTION

Never sterilize the transducer with autoclave, gamma-radiation, gas, steam, or heat sterilization techniques. Severe damage will result. Avoidable transducer damage is not covered by the warranty or service contract.

CAUTION

Do not expose the transducer to cleaning and disinfectant agents for extended periods of time. Limit the time that transducers are exposed to cleaning and disinfectant agents to the minimum time recommended by the manufacturer.

CAUTION

Before storing transducers, ensure that they are thoroughly dry. If it is necessary to dry the transducer lens (acoustic window) after cleaning, use a soft cloth and a gentle wiping or blotting motion. Aggressive wiping or scrubbing can damage the lens.
Minimizing the Effects of Residual Disinfectant

If you use an OPA (ortho-phthalaldehyde) based disinfectant, residual solution may remain on your transducers if you do not carefully follow the manufacturer’s instructions.

To minimize the effects from residual OPA, or any other disinfectant, do the following:

- Follow the disinfectant manufacturer’s instructions very carefully. For example, the manufacturer of Cidex OPA recommends rinsing transducers by immersing them three times in fresh water.

- Limit the time that transducers are exposed to the disinfectant to the minimum time recommended by the disinfectant manufacturer. For example, the manufacturer of Cidex OPA recommends a minimum of 12 minutes.

Cleaning Non-TEE Transducers, Cables, and Connectors

These general cleaning instructions must be followed for all non-TEE transducers, cables, and connectors.

All transducers must be cleaned after each use. Cleaning the transducer is an essential step before effective disinfection or sterilization. Before cleaning a transducer, read the “Safety” section and “Warnings and Cautions for Non-TEE Transducers” on page 35.

After cleaning, you must disinfect or sterilize non-TEE transducers by following the appropriate procedures:

- “Low-Level Disinfecting Non-TEE Transducers” on page 44
- “High-Level Disinfecting Non-TEE Transducers” on page 46
- “Sterilizing Non-TEE Transducers” on page 49

WARNING

Always use protective eyewear and gloves when cleaning, disinfecting, or sterilizing any equipment.
Recommended supplies:

- Soft moist cloth or non-abrasive sponge
- Compatible cleaners or cleaning wipes for the transducer, cable, and connector (enzymatic cleaners are recommended)
- Dry, lint-free cloths

1. After every patient study, remove the ultrasound transmission gel from the transducer by using a soft moist cloth dampened with potable water or an approved cleaning or disinfectant agent or by using an approved pre-saturated cleaning or disinfectant wipe. Use a gentle wiping or blotting motion to remove gel from the lens. For a list of compatible cleaning or disinfectant agents, see *Disinfectants and Cleaning Solutions for Ultrasound Systems and Transducers*, which is available with your system documentation or on the "Transducer and System Care" website:

   www.philips.com/transducercare

   Follow the label instructions for preparation, temperature, solution strength, and duration of contact. Ensure that the solution strength and duration of contact are appropriate for the intended clinical use of the device. If a pre-mixed solution is used, be sure to observe the solution expiration date.

2. Disconnect the transducer from the system, and remove any accessories attached to or covering the transducer. Push the connector cover, if available, onto the connector to protect against fluid splashing onto the contacts.

3. Remove any remaining gel from the transducer and lens by using running water and a soft sponge or gloved hand. If running water is not available, use a pre-moistened soft cloth, such as a flushable cleansing cloth. Use a gentle wiping or blotting motion to remove gel from the lens.

   When cleaning the connector, do not allow any fluid to enter the connector through the electrical contacts, strain reliefs, connector housing, or areas surrounding the locking lever shaft. When wiping or spraying the connector, wipe or spray only the outer surfaces of the connector housing.
4. To remove any particulate matter or body fluids that remain on the transducer, cable, or connector, use a soft cloth lightly dampened in a mild soap or an enzymatic cleaner (in accordance with the manufacturer's instructions). Enzymatic cleaners are generically compatible for use.

5. When cleaning the lens, use a blotting motion rather than a wiping motion.

6. To remove remaining particulate and cleaning residue, use cleaning wipes according to the manufacturers' instructions, or rinse thoroughly with water up to the immersion point shown in the figure following this procedure. Do not immerse the connector, connector strain relief, or cable that is within 5 cm (2 in) of the connector strain relief. (Up to 5 cm from the strain relief is the maximum allowable immersion point of the cable—you are not required to immerse to that point if it is unnecessary.)

**NOTE**

If you use cleaning wipes, it may be unnecessary to rinse the transducer with water. Always follow the product label recommendations.

7. Air dry or use a soft cloth to dry the transducer. To dry the lens, use a blotting motion instead of a wiping motion.

8. Examine the device and cable for damage such as cracks, splitting, sharp edges, or projections. If damage is evident, discontinue use of the device and contact your Philips representative.
Immersion Point for Non-TEE Transducers

1  Do not immerse beyond this point, 5 cm (2 in) from the strain relief; this is the maximum allowable immersion of the cable—you are not required to immerse to this point if it is unnecessary.

Low-Level Disinfecting Non-TEE Transducers

Low-level disinfection of non-TEE transducers uses the spray or wipe method, with a low- or intermediate-level disinfectant. Before performing this procedure, read the warnings and cautions in the “Safety” section and “Warnings and Cautions for Non-TEE Transducers” on page 35, and observe the following precautions.

WARNING

Always use protective eyewear and gloves when cleaning, disinfecting, or sterilizing any equipment.
CAUTION
When cleaning and disinfecting transducers, do not allow any fluid to enter the connector through the electrical contacts, strain reliefs, connector housing, or areas surrounding the locking lever shaft. On TEE transducers, do not allow any fluid to enter the handle or steering mechanism. When wiping or spraying connector or handle housings, wipe or spray only the outer surfaces. If available, place a connector-cover splash guard over the electrical contacts to help prevent fluid from entering the connector housing. Damage due to fluids in these areas is not covered by the warranty or your service contract.

NOTE
Transducers can be disinfected using the wipe method only if the product labeling of the compatible disinfectant that you are using indicates it can be used with a wipe method.

Recommended supplies:
- Soft moist cloth or non-abrasive sponge
- Compatible low-level or intermediate-level disinfectants for the transducer, cable, strain relief, and connector
- Dry, lint-free, sterile cloth

1. Clean the transducer and cable according to the procedures in “Cleaning Non-TEE Transducers, Cables, and Connectors” on page 41. Observe all warnings and cautions.

2. After cleaning, choose low- or intermediate-level disinfectants that are compatible with your transducer, cable, and connector. For a list of compatible disinfectants, see Disinfectants and Cleaning Solutions for Ultrasound Systems and Transducers, which is available with your system documentation or on the "Transducer and System Care" website:

   www.philips.com/transducercare
Follow the label instructions for preparation, temperature, solution strength, and duration of contact. Ensure that the solution strength and duration of contact are appropriate for the intended clinical use of the device. If a pre-mixed solution is used, be sure to observe the solution expiration date.

3. Wipe or spray the transducer, cable, strain relief, and connector with the disinfectant, following disinfectant label instructions for temperature, wipe durations, and duration of disinfectant contact. Ensure that the disinfectant solution does not enter the device or the connector.

When disinfecting the connector housing, wipe or spray only the outer surfaces; do not allow any type of fluid to enter through the strain relief, electrical contacts, or areas surrounding the locking lever shaft.

4. Air dry or use a soft cloth to dry the transducer. To dry the lens, use a blotting motion instead of a wiping motion.

5. Examine the transducer for damage, such as cracks, splitting, fluid leaks, or sharp edges or projections. If damage is evident, discontinue use of the transducer and contact your Philips representative.

**High-Level Disinfecting Non-TEE Transducers**

High-level disinfection of non-TEE transducers typically uses the immersion method with a high-level disinfectant. Before performing this procedure, read the warnings and cautions in the “Safety” section and “Warnings and Cautions for Non-TEE Transducers” on page 35, and observe the following precautions.

**WARNING**

Always use protective eyewear and gloves when cleaning, disinfecting, or sterilizing any equipment.
CAUTION

When cleaning and disinfecting transducers, do not allow any fluid to enter the connector through the electrical contacts, strain reliefs, connector housing, or areas surrounding the locking lever shaft. On TEE transducers, do not allow any fluid to enter the handle or steering mechanism. When wiping or spraying connector or handle housings, wipe or spray only the outer surfaces. If available, place a connector-cover splash guard over the electrical contacts to help prevent fluid from entering the connector housing. Damage due to fluids in these areas is not covered by the warranty or your service contract.

NOTE

Some high-level disinfectants do not require immersion and are compatible with some non-TEE transducers. For compatible high-level disinfectants, see Disinfectants and Cleaning Solutions for Ultrasound Systems and Transducers. If you choose to use those disinfectants, always follow the manufacturer’s instructions for use. Follow the procedures in this manual that correspond to the “Qualified Use” disinfection method for the selected disinfectant, as defined in Disinfectants and Cleaning Solutions for Ultrasound Systems and Transducers.

Recommended supplies:

- Soft moist cloth or non-abrasive sponge
- Compatible high-level disinfectants for the transducer, cable, and connector
- Soaking container
- Dry, lint-free, sterile cloth

1. Clean the transducer and cable according to the procedures in “Cleaning Non-TEE Transducers, Cables, and Connectors” on page 41. Observe all warnings and cautions.

2. After cleaning, choose a high-level disinfectant that is compatible with your transducer. For a list of compatible disinfectants, see Disinfectants and Cleaning Solutions for Ultrasound Systems and Transducers, which is available with your system documentation or on the "Transducer and System Care" website:
www.philips.com/transducercare

Follow the label instructions for preparation, temperature, solution strength, and duration of contact. Ensure that the solution strength and duration of contact are appropriate for the intended clinical use of the device. If a pre-mixed solution is used, be sure to observe the solution expiration date.

3. Using an appropriate disinfectant for the cable and connector, wipe or spray the cable, strain relief, and connector, following disinfectant label instructions for temperature, wipe durations, solution strengths, and duration of disinfectant contact. Ensure that the disinfectant solution does not enter the device or the connector.

When disinfecting the connector housing, wipe or spray only the outer surfaces; do not allow any type of fluid to enter through the strain relief, electrical contacts, or areas surrounding the locking lever shaft.

4. Immerse the transducer into the appropriate disinfectant for your transducer as shown in the figure following this procedure. Do not immerse the connector, connector strain relief, or cable within 5 cm (2 in) of the connector strain relief. (Up to 5 cm from the strain relief is the maximum allowable immersion point of the cable—you are not required to immerse to that point if it is unnecessary.)

5. Follow the instructions on the disinfectant label for the duration of transducer immersion. Do not immerse transducers longer than the minimum time needed for your level of disinfection.

6. Using the instructions on the disinfectant label, rinse the transducer up to the point of immersion. Do not immerse the connector, connector strain relief, or cable within 5 cm (2 in) of the connector strain relief. (Up to 5 cm from the strain relief is the maximum allowable immersion point of the cable—you are not required to immerse to that point if it is unnecessary.)

7. Air dry or use a soft sterile cloth to dry the transducer. To dry the lens, use a blotting motion instead of a wiping motion.

8. Examine the transducer for damage, such as cracks, splitting, fluid leaks, or sharp edges or projections. If damage is evident, discontinue use of the transducer and contact your Philips representative.
Immersion Point for Non-TEE Transducers

1  Do not immerse beyond this point, 5 cm (2 in) from the strain relief; this is the maximum allowable immersion of the cable—you are not required to immerse to this point if it is unnecessary.

Sterilizing Non-TEE Transducers

Sterilization is required if the transducer enters otherwise sterile tissue without a sterile cover. If you use a sterile cover, sterilization is still recommended, but high-level disinfection is acceptable. The main difference between sterilization and high-level disinfection is the length of time that the transducer is immersed and the type of disinfectant or sterilant that is used.

To determine if your transducer requires sterilization or high-level disinfection, see “Transducer Care Methods” on page 31.

Before performing this procedure, read the warnings and cautions in the “Safety” section and “Warnings and Cautions for Non-TEE Transducers” on page 35.

WARNING

Always use protective eyewear and gloves when cleaning, disinfecting, or sterilizing any equipment.
CAUTION
Never sterilize the transducer with autoclave, gamma-radiation, gas, steam, or heat sterilization techniques. Severe damage will result. Avoidable transducer damage is not covered by the warranty or service contract.

CAUTION
When cleaning and disinfecting transducers, do not allow any fluid to enter the connector through the electrical contacts, strain reliefs, connector housing, or areas surrounding the locking lever shaft. On TEE transducers, do not allow any fluid to enter the handle or steering mechanism. When wiping or spraying connector or handle housings, wipe or spray only the outer surfaces. If available, place a connector-cover splash guard over the electrical contacts to help prevent fluid from entering the connector housing. Damage due to fluids in these areas is not covered by the warranty or your service contract.

Recommended supplies:
- Soft moist cloth or non-abrasive sponge
- Compatible high-level disinfectants for the transducer, cable, and connector
- Compatible sterilant for the transducer and cable
- Soaking container
- Dry, lint-free, sterile cloth

1. Clean the transducer and cable according to the procedures in “Cleaning Non-TEE Transducers, Cables, and Connectors” on page 41.

2. After cleaning, choose the high-level disinfectant or sterilant that is compatible with your transducer. For a list of compatible disinfectants and sterilants, see Disinfectants and Cleaning Solutions for Ultrasound Systems and Transducers, which is available with your system documentation or on the "Transducer and System Care" website:
   www.philips.com/transducercare
Follow the label instructions for preparation, temperature, solution strength, and duration of contact. Ensure that the solution strength and duration of contact are appropriate for the intended clinical use of the device. If a pre-mixed solution is used, be sure to observe the solution expiration date.

3. Using an appropriate disinfectant for the cable and connector, wipe or spray the cable, strain relief, and connector, following disinfectant label instructions for temperature, wipe durations, solution strengths, and duration of disinfectant contact. Ensure that the disinfectant solution does not enter the device or the connector.

When disinfecting the connector housing, wipe or spray only the outer surfaces; do not allow any type of fluid to enter through the strain relief, electrical contacts, or areas surrounding the locking lever shaft.

4. Immerse the transducer in the sterilization solution as shown in the figure following this procedure. Do not immerse the connector, connector strain relief, or cable within 5 cm (2 in) of the connector strain relief. (Up to 5 cm from the strain relief is the maximum allowable immersion point of the cable—you are not required to immerse to that point if it is unnecessary.)

5. Follow the instructions on the sterilization label for the duration of transducer immersion required for sterilization.

6. Remove the transducer from the sterilization solution after the recommended sterilization time has elapsed.

7. Using the instructions on the sterilization label, rinse the transducer in sterile water up to the point of immersion. Do not immerse the connector, connector strain relief, or cable within 5 cm (2 in) of the connector strain relief. (Up to 5 cm from the strain relief is the maximum allowable immersion point of the cable—you are not required to immerse to that point if it is unnecessary.)

8. Air dry or use a soft sterile cloth to dry the transducer. To dry the lens, use a blotting motion instead of a wiping motion.

9. Examine the transducer for damage, such as cracks, splitting, fluid leaks, or sharp edges or projections. If damage is evident, discontinue use of the transducer, and contact your Philips representative.
Immersion Point for Non-TEE Transducers

1. Do not immerse beyond this point, 5 cm (2 in) from the strain relief; this is the maximum allowable immersion of the cable—you are not required to immerse to this point if it is unnecessary.

**USB Transducer Care**

The following topics explain how to clean, disinfect, and sterilize transducers with USB connectors. To determine the appropriate care method for your transducer, see “Transducer Care Methods” on page 31. The following figure identifies the components of a transducer with a USB connector.
USB Transducer Care

USB Transducer Components

1. Transducer lens (acoustic window)
2. Transducer housing
3. Transducer strain relief
4. Cable
5. Ferrite bead
6. USB connector strain relief
7. USB connector
8. Electrical contacts

Warnings and Cautions for USB Transducers

Observe the following warnings and cautions during all cleaning and disinfection procedures, and when using disinfectants. More specific warnings and cautions are included within the care and cleaning procedures and on the labels of the cleaners or disinfectants.
WARNING
Transducers must be cleaned after each use. Cleaning the transducer is an essential step before effective disinfection or sterilization. Be sure to follow the manufacturer’s instructions when using disinfectants.

WARNING
Always use protective eyewear and gloves when cleaning, disinfecting, or sterilizing any equipment.

WARNING
Disinfectants are recommended because of their chemical compatibility with product materials, not their biological effectiveness. For the biological effectiveness of a disinfectant, see the guidelines and recommendations of the disinfectant manufacturer, the U.S. Food and Drug Administration, and the U.S. Centers for Disease Control.

WARNING
The level of disinfection required for a device is dictated by the type of tissue it will contact during use and the type of transducer being used. Ensure that the disinfectant type is appropriate for the type of transducer and the transducer application. For information on the levels of disinfection requirements, see “Transducer Care Methods” on page 31. Also, see the disinfectant label instructions and the recommendations of the Association for Professionals in Infection Control, the U.S. Food and Drug Administration, and the U.S. Centers for Disease Control.
WARNING
If a pre-mixed solution is used, be sure to observe the solution expiration date.

WARNING
Follow the recommendations of the disinfectant manufacturer.

CAUTION
Using non-recommended disinfectants, using incorrect solution strengths, or immersing a transducer deeper or longer than recommended can damage or discolor the transducer and voids the transducer warranty.

CAUTION
On transducers with USB connectors, the only parts that may be cleaned with isopropyl alcohol are the transducer housing and lens (acoustic window). Ensure that the solution is only 70% alcohol or less. Do not clean any other part of a transducer with isopropyl alcohol (including cables, USB connectors, or strain reliefs), as it can damage those parts of the transducer. This damage is not covered by the warranty or your service contract.
Alcohol-Compatible Parts of USB Transducers

1. The only parts that may be cleaned with 70% isopropyl alcohol solutions are the transducer housing and lens (acoustic window). Do not allow fluid to enter any unsealed area of the transducer. When cleaning the lens surface, use a gentle wiping or blotting motion. Aggressive wiping or scrubbing can damage the lens.

**CAUTION**

When using an enzymatic cleaner, be sure to use the proper concentration and rinse thoroughly. Enzymatic cleaners are generically compatible for use.

**CAUTION**

Attempting to clean or disinfect a transducer, cable, or connector housing by using a method other than the procedures here can damage the device and voids the warranty.
CAUTION
Do not allow sharp objects, such as scissors, scalpels, or cauterizing knives, to touch transducers or cables.

CAUTION
When handling a transducer, do not bump the transducer on hard surfaces.

CAUTION
Do not use a surgeon's brush when cleaning transducers. Even the use of soft brushes can damage transducers.

CAUTION
Do not use a brush on the transducer label.

CAUTION
Do not use paper products or abrasive products when cleaning a transducer. They damage the soft lens (acoustic window) of the transducer. The use of abrasive industrial wipes such as Wypall X60 can damage the lens.

CAUTION
During cleaning, disinfection, and sterilization, orient the parts of the transducer, connector housing, or cable that must remain dry higher than the wet parts, until all parts are dry. This helps keep liquid from entering unsealed areas of the transducer.
CAUTION
When cleaning and disinfecting transducers, do not allow any fluid to enter electrical connections or metal portions of the USB connector. Damage due to fluids in these areas is not covered by the warranty or your service contract.

CAUTION
To keep fluids from entering the transducer, do not disconnect the USB cable from the transducer during cleaning and disinfection.

CAUTION
Do not expose the transducer to cleaning and disinfectant agents for extended periods of time. Limit the time that transducers are exposed to cleaning and disinfectant agents to the minimum time recommended by the manufacturer.

CAUTION
Before storing transducers, ensure that they are thoroughly dry. If it is necessary to dry the transducer lens or acoustic window after cleaning, use a soft cloth and a gentle wiping or blotting motion. Aggressive wiping or scrubbing can damage the lens.

CAUTION
Use only liquid solutions to sterilize transducers. Using autoclave, gas (EtO), or other methods not approved by Philips will damage your transducer and void your warranty.
Minimizing the Effects of Residual Disinfectant

If you use an OPA (ortho-phthalaldehyde) based disinfectant, residual solution may remain on your transducers if you do not carefully follow the manufacturer’s instructions.

To minimize the effects from residual OPA, or any other disinfectant, do the following:

- Follow the disinfectant manufacturer’s instructions very carefully. For example, the manufacturer of Cidex OPA recommends rinsing transducers by immersing them three times in fresh water.
- Limit the time that transducers are exposed to the disinfectant to the minimum time recommended by the disinfectant manufacturer. For example, the manufacturer of Cidex OPA recommends a minimum of 12 minutes.

Cleaning USB Transducers, Cables, and Connectors

These general cleaning instructions must be followed for all USB transducers, cables, and connectors. All transducers must be cleaned after each use. Cleaning the transducer is an essential step before effective disinfection or sterilization.

Before cleaning a transducer, read the warnings and cautions in the “Safety” section and “Warnings and Cautions for USB Transducers” on page 53 and observe the following precautions.

After cleaning, you must disinfect transducers by following the appropriate procedures:

- “Low-Level Disinfecting USB Transducers” on page 62
- “High-Level Disinfecting USB Transducers” on page 64
- “Sterilizing USB Transducers” on page 67

WARNING

Always use protective eyewear and gloves when cleaning, disinfecting, or sterilizing any equipment.
CAUTION

When cleaning and disinfecting transducers, do not allow any fluid to enter electrical connections or metal portions of the USB connector. Damage due to fluids in these areas is not covered by the warranty or your service contract.

CAUTION

To keep fluids from entering the transducer, do not disconnect the USB cable from the transducer during cleaning and disinfection.

Recommended supplies:

- Soft moist cloth or non-abrasive sponge
- Compatible cleaners or cleaning wipes for the transducer, cable, and connector (enzymatic cleaners are recommended)
- Dry, lint-free cloths

1. After every patient study, remove the ultrasound transmission gel from the transducer by using a soft moist cloth dampened with potable water or an approved cleaning or disinfectant agent or by using an approved pre-saturated cleaning or disinfectant wipe. Use a gentle wiping or blotting motion to remove gel from the lens. For a list of compatible cleaning or disinfectant agents, see Disinfectants and Cleaning Solutions for Ultrasound Systems and Transducers, which is available with your system documentation or on the "Transducer and System Care" website:

www.philips.com/transducercare

Follow the label instructions for preparation, temperature, solution strength, and duration of contact. Ensure that the solution strength and duration of contact are appropriate for the intended clinical use of the device. If a pre-mixed solution is used, be sure to observe the solution expiration date.
2. Disconnect the transducer from the system, and remove any accessories attached to or covering the transducer. Push the connector cover, if available, onto the connector to protect against fluid splashing onto the contacts.

3. Remove any remaining gel from the transducer and lens by using running water and a soft sponge or gloved hand. If running water is not available, use a pre-moistened soft cloth, such as a flushable cleansing cloth. Use a gentle wiping or blotting motion to remove gel from the lens.

4. To remove any particulate matter or body fluids that remain on the transducer, cable, ferrite bead, or connector, use a soft cloth lightly dampened in a mild soap or an enzymatic cleaner (in accordance with the manufacturer's instructions). Enzymatic cleaners are generically compatible for use.

5. To remove remaining particulate and cleaning residue, use cleaning wipes according to the manufacturer's instructions. You may rinse the transducer thoroughly with water up to the immersion point shown in the figure following this procedure. No other part of the transducer, cable, or USB connector can be soaked or immersed in fluids.

**NOTE**

If you use cleaning wipes, it may be unnecessary to rinse the transducer with water. Always follow the product label instructions.

6. If necessary, wipe the transducer with a dry cloth. To dry the lens, use a soft cloth and a blotting motion; do not wipe the lens.

7. Examine the device and cable for damage such as cracks, splitting, sharp edges, or projections. If damage is evident, discontinue use of the device and contact your Philips representative.

**Low-Level Disinfecting USB Transducers**

Low-level disinfection of USB transducers uses the spray or wipe method, with a low-level or intermediate-level disinfectant. Before performing this procedure, read the warnings and cautions in the “Safety” section and “Warnings and Cautions for USB Transducers” on page 53 and observe the following precautions.

**WARNING**

Always use protective eyewear and gloves when cleaning, disinfecting, or sterilizing any equipment.
CAUTION
When cleaning and disinfecting transducers, do not allow any fluid to enter electrical connections or metal portions of the USB connector. Damage due to fluids in these areas is not covered by the warranty or your service contract.

CAUTION
To keep fluids from entering the transducer, do not disconnect the USB cable from the transducer during cleaning and disinfection.

NOTE
Transducers can be disinfected using the wipe method only if the product labeling of the compatible disinfectant you are using indicates it can be used with a wipe method.

Recommended supplies:
- Soft moist cloth or non-abrasive sponge
- Compatible low-level or intermediate-level disinfectants for the transducer, cable, and connector
- Dry, lint-free, sterile cloth

1. Clean the transducer and cable according to the procedures in “Cleaning USB Transducers, Cables, and Connectors” on page 59. Observe all warnings and cautions.
2. After cleaning, choose a low-level or intermediate-level disinfectant that is compatible with your transducer. For a list of compatible disinfectants, see Disinfectants and Cleaning Solutions for Ultrasound Systems and Transducers, which is available with your system documentation or on the "Transducer and System Care" website:
www.philips.com/transducercare
Follow the label instructions for preparation, temperature, solution strength, and duration of contact. Ensure that the solution strength and duration of contact are appropriate for the intended clinical use of the device. If a pre-mixed solution is used, be sure to observe the solution expiration date.

3. Using an appropriate disinfectant for the USB cable and connector, wipe or spray the cable, strain relief, ferrite bead, and USB connector, following disinfectant label instructions for temperature, wipe durations, solution strengths, and duration of disinfectant contact. Ensure that the disinfectant solution does not enter the device or the connector. When disinfecting the USB cable, wipe or spray only the outer surfaces; do not allow any type of fluid to enter through the strain relief, connector, or electrical contacts. Fluid in the connector may void the device warranty.

4. Air dry or use a soft sterile cloth to dry the transducer according to the instructions on the disinfectant label.

5. Examine the transducer for damage, such as cracks, splitting, fluid leaks, or sharp edges or projections. If damage is evident, discontinue use of the transducer and contact your Philips representative.

**High-Level Disinfecting USB Transducers**

High-level disinfection of USB transducers typically uses an immersion method, with high-level disinfectants. Before performing this procedure, read the warnings and cautions in the “Safety” section and “Warnings and Cautions for USB Transducers” on page 53 and observe the following precautions.

**WARNING**

Always use protective eyewear and gloves when cleaning, disinfecting, or sterilizing any equipment.
**CAUTION**

When cleaning and disinfecting transducers, do not allow any fluid to enter electrical connections or metal portions of the USB connector. Damage due to fluids in these areas is not covered by the warranty or your service contract.

**CAUTION**

To keep fluids from entering the transducer, do not disconnect the USB cable from the transducer during cleaning and disinfection.

Recommended supplies:

- Soft moist cloth or non-abrasive sponge
- Compatible high-level disinfectants for the transducer, cable, and connector
- Soaking container
- Dry, lint-free, sterile cloth

1. Clean the transducer and cable according to the procedures in “Cleaning USB Transducers, Cables, and Connectors” on page 59. Observe all warnings and cautions.

2. After cleaning, choose a high-level disinfectant that is compatible with your transducer. For a list of compatible disinfectants, see Disinfectants and Cleaning Solutions for Ultrasound Systems and Transducers, which is available with your system documentation or on the "Transducer and System Care" website:

   www.philips.com/transducercare

Follow the label instructions for preparation, temperature, solution strength, and duration of contact. Ensure that the solution strength and duration of contact are appropriate for the intended clinical use of the device. If a pre-mixed solution is used, be sure to observe the solution expiration date.
3. Using an appropriate disinfectant for the USB cable and connector, wipe or spray the cable, strain relief, ferrite bead, and USB connector, following disinfectant label instructions for temperature, wipe durations, solution strengths, and duration of disinfectant contact. Ensure that the disinfectant solution does not enter the device or the connector. When disinfecting the USB cable, wipe or spray only the outer surfaces; do not allow any type of fluid to enter through the strain relief, connector, or electrical contacts. Fluid in the connector may void the device warranty.

4. Immerse the transducer into the appropriate disinfectant for your transducer as shown in the figure following this procedure. The transducer may be immersed only up to the immersion point shown. No other part of the transducer, cable, strain reliefs, or connector can be soaked or immersed in fluids.

5. Follow the instructions on the disinfectant label for the duration of transducer immersion. Do not immerse transducers longer than the minimum time needed for your level of disinfection.

6. Using the instructions on the disinfectant label, rinse the transducer up to the point of immersion. Do not soak or immerse any other part of the transducer, cable, strain reliefs, or connector.

7. Air dry or use a soft sterile cloth to dry the transducer according to the instructions on the disinfectant label.

8. Examine the transducer for damage, such as cracks, splitting, fluid leaks, or sharp edges or projections. If damage is evident, discontinue use of the transducer and contact your Philips representative.
Immersion Point for USB Transducers

<tr>
<td>2</td>
<td>Maximum allowable immersion depth; you are not required to immerse to this depth if it is unnecessary.</td>
</tr>
</tbody>
</table>

**Sterilizing USB Transducers**

The main difference between high-level disinfection and sterilization is the length of time that the transducer is immersed and the type of disinfectant or sterilant used. For sterilization, follow the same procedures as high-level disinfection, but use a compatible sterilant and follow the manufacturer's instructions for preparation, temperature, solution strength, and duration of contact.
**TEE Transducer Care**

The following topics explain how to clean, disinfect, and sterilize transesophageal echocardiographic (TEE) transducers. To determine the appropriate care method for your transducer, see **“Transducer Care Methods” on page 31.**

Upon receiving your new transducer, disinfect it before performing the first study. Clean and disinfect the transducer immediately after each use to protect patients and personnel from pathogens. Establish and clearly post a cleaning procedure that includes the steps described in this section.

The following figure identifies the components of a TEE Transducer.

**Warnings and Cautions for TEE Transducers**

Observe the following warnings and cautions during all cleaning, disinfection, and sterilization procedures, and when using disinfectants. More specific warnings and cautions are included within the care and cleaning procedures and on the labels of the cleaners or disinfectants.

**WARNING**

Transducers must be cleaned after each use. Cleaning the transducer is an essential step before effective disinfection or sterilization. Be sure to follow the manufacturer’s instructions when using disinfectants.

**WARNING**

Always use protective eyewear and gloves when cleaning, disinfecting, or sterilizing any equipment.

**CAUTION**

Never sterilize the transducer with autoclave, gamma-radiation, gas, steam, or heat sterilization techniques. Severe damage will result. Avoidable transducer damage is not covered by the warranty or service contract.
WARNING
Sterile transducer covers are disposable and must not be reused.

WARNING
Bite guards are mandatory for TEE transducers.

WARNING
Disinfectants are recommended because of their chemical compatibility with product materials, not their biological effectiveness. For the biological effectiveness of a disinfectant, see the guidelines and recommendations of the disinfectant manufacturer, the U.S. Food and Drug Administration, and the U.S. Centers for Disease Control.

WARNING
The level of disinfection required for a device is dictated by the type of tissue it will contact during use and the type of transducer being used. Ensure that the disinfectant type is appropriate for the type of transducer and the transducer application. For information on the levels of disinfection requirements, see “Transducer Care Methods” on page 31. Also, see the disinfectant label instructions and the recommendations of the Association for Professionals in Infection Control, the U.S. Food and Drug Administration, and the U.S. Centers for Disease Control.

WARNING
When sterilizing a transducer, ensure that the sterilant’s strength and duration of contact are appropriate for sterilization. Be sure to follow the manufacturer’s instructions.
WARNING
If a pre-mixed solution is used, be sure to observe the solution expiration date.

WARNING
Follow the recommendations of the disinfectant manufacturer.

CAUTION
Using non-recommended disinfectants, using incorrect solution strengths, or immersing a transducer deeper or longer than recommended can damage or discolor the transducer and voids the transducer warranty.

CAUTION
On TEE transducers, the only parts that may be cleaned with isopropyl alcohol are the connector housing and the control housing. Ensure that the solution is only 70% alcohol or less. Do not clean any other part of a transducer with isopropyl alcohol (including cables or strain reliefs), as it can damage those parts of the transducer. This damage is not covered by the warranty or your service contract.
Alcohol-Compatible TEE Transducer Parts

1. The only parts that may be cleaned with 70% isopropyl alcohol solutions are the connector housing and control housing. Do not allow fluid to enter any unsealed area of the transducer.

**CAUTION**

When using an enzymatic cleaner, be sure to use the proper concentration and rinse thoroughly. Enzymatic cleaners are generically compatible for use.

**CAUTION**

Do not use bleach on the transducer and shaft.

**CAUTION**

Attempting to clean or disinfect a transducer, cable, or connector housing by using a method other than the procedures here can damage the device and voids the warranty.

**CAUTION**

Do not allow sharp objects, such as scissors, scalpels, or cauterizing knives, to touch transducers or cables.
CAUTION

When handling a transducer, do not bump the transducer on hard surfaces.

CAUTION

On TEE transducers, do not crimp the flexible shaft or cable. Do not bend the shaft into a circle with a diameter of less than 0.3 m (1 ft).

CAUTION

Do not use a surgeon’s brush when cleaning transducers. Even the use of soft brushes can damage transducers.

CAUTION

Do not use a brush on the connector housing label.

CAUTION

Do not use paper products or abrasive products when cleaning a transducer. They damage the soft lens (acoustic window) of the transducer. The use of abrasive industrial wipes such as Wypall X60 can damage the lens.

CAUTION

During cleaning, disinfection, and sterilization, orient the parts of the transducer, connector housing, or cable that must remain dry higher than the wet parts, until all parts are dry. This helps keep liquid from entering unsealed areas of the transducer.
CAUTION
When cleaning and disinfecting transducers, do not allow any fluid to enter the connector through the electrical contacts, strain reliefs, connector housing, or areas surrounding the locking lever shaft. On TEE transducers, do not allow any fluid to enter the handle or steering mechanism. When wiping or spraying connector or handle housings, wipe or spray only the outer surfaces. If available, place a connector-cover splash guard over the electrical contacts to help prevent fluid from entering the connector housing. Damage due to fluids in these areas is not covered by the warranty or your service contract.

CAUTION
Do not expose the transducer to cleaning and disinfectant agents for extended periods of time. Limit the time that transducers are exposed to cleaning and disinfectant agents to the minimum time recommended by the manufacturer.

CAUTION
The transducer steering mechanism for TEE transducers is unsealed. If disinfectant or other fluid enters the steering mechanism, it corrodes the gears and electrical connections. Avoidable transducer damage is not covered by the warranty or service contract.

CAUTION
Do not rinse or immerse the TEE transducer handle, steering mechanism, cable, connector, or strain reliefs.
CAUTION
Before storing transducers, ensure that they are thoroughly dry. If it is necessary to dry the transducer lens (acoustic window) after cleaning, use a soft cloth and a gentle wiping or blotting motion. Aggressive wiping or scrubbing can damage the lens.

Minimizing the Effects of Residual Disinfectant
If you use an OPA (ortho-phthalaldehyde) based disinfectant, residual solution may remain on your transducers if you do not carefully follow the manufacturer’s instructions.

WARNING
Residual OPA on TEE transducers may cause temporary staining of the mouth and lip area and irritation or chemical burns of the mouth, throat, esophagus, and stomach.

To minimize the effects from residual OPA, or any other disinfectant, do the following:
• Follow the disinfectant manufacturer’s instructions very carefully. For example, the manufacturer of Cidex OPA recommends rinsing transducers by immersing them three times in fresh water.
• Limit the time that transducers are exposed to the disinfectant to the minimum time recommended by the disinfectant manufacturer. For example, the manufacturer of Cidex OPA recommends a minimum of 12 minutes.

S7-3t and S8-3t Cautions
Because of their small size, the S7-3t and S8-3t transducers are very delicate electronic instruments. To avoid damaging the transducers, observe the following cautions.
CAUTION
When wiping the distal tip of the S7-3t or the S8-3t transducer, never apply excessive force to the lens (acoustic window). Gently wipe the tip with a moist cloth. Do not squeeze the lens, the acoustic window, or the tip, because this may damage the transducer.

CAUTION
Do not allow sharp objects, such as scissors, scalpels, or cauterizing knives, to touch transducers or cables.

CAUTION
Articulate the tip only with the controls; do not articulate it with your hand.

CAUTION
Do not bend or crimp the flexible shaft or cable.

CAUTION
When handling a transducer, do not bump the transducer on hard surfaces.

Guidelines for TEE Transducers
The guidelines provided here are intended for Philips TEE transducers.
Disinfection or sterilization by immersion is the accepted method of infection control for TEE transducers. Sterilization is required if the transducer enters otherwise sterile tissue without a sterile cover. If you use a sterile cover, sterilization is still recommended, but high-level disinfection is acceptable. The main difference between sterilization and high-level disinfection is the length of time that the transducer is immersed and the type of disinfectant or sterilant used.

To determine if your transducer requires sterilization or high-level disinfection, see “Transducer Care Methods” on page 31.

Disinfection or sterilization of TEE transducers is performed either by manual soaking or by using an automated endoscope reprocessor (AER). Alternative sterilization techniques (such as ethylene oxide, gamma radiation, or autoclave) are prohibited. Before either disinfection or sterilization, thorough cleaning of the device is required. Enzymatic detergents are generically approved and are recommended for efficient cleaning.

The TEE transducer handle and connector are not patient-contacting and do not require the same level of disinfection as the patient-contacting flexible shaft and distal tip. Therefore, separate procedures are provided for disinfecting/sterilizing the patient contacting and non-patient contacting parts. Adhering to these procedures is critical to ensuring the long term reliability of the device.
Summary of Parts to Disinfect on a TEE Transducer

The following illustration provides a summary of the parts to disinfect on a TEE transducer. For the full procedure, see “Cleaning, Disinfecting, and Sterilizing TEE Transducers by Immersion or AER” on page 80.

Parts to Disinfect on a TEE Transducer

| 1 and 2 | Spray and wipe these parts of the transducer with disinfectants that are compatible with the various parts. Do not immerse or rinse these parts; do not allow fluid to enter any unsealed opening. |
| 1 | If you want to use alcohol, only the outside of the handle housing and connector housing are compatible with 70% isopropyl alcohol. Lightly wipe with a pad moistened with the alcohol. Do not immerse or rinse these parts; do not allow fluid to enter any unsealed opening. |
| 3 | Only the flexible shaft can be immersed or rinsed. Soak for the minimum time recommended by the disinfectant manufacturer; do not immerse deeper or longer than recommended. |
| 4 | Immerse only to within 5 cm (2 in) from the strain relief; this is the maximum allowable immersion of the cable – you are not required to immerse to this point if it is not necessary. |
Guidelines for AER (Automated Endoscope Reprocessor)

Only some transducers are compatible with an automated endoscope reprocessor (AER), and the AER can use only specific solutions.

You can reprocess Philips TEE transducers in an AER, if the following criteria are met:

- All chemicals used must be compatible with the specific Philips TEE transducer model being reprocessed, and they must be used under the conditions recommended by the AER manufacturer.
- The temperature used during reprocessing must not exceed 45°C (113°F).
- The TEE transducer handle and connector must be isolated from the cleaning or disinfectant solution throughout the reprocessing, including handle support stands and sealing mechanisms. This limits the risk of splashing onto the handle or connector.
- The use of protective barriers or devices intended to isolate the handle and connector to allow the entire transducer to be completely submerged during AER use is prohibited.
- Heated drying methods may not be used.

The following are examples of AERs that meet the reprocessing requirements of Philips TEE transducers. These AERs are either specifically designed for, or provide attachments that support, TEE transducer reprocessing.

**Examples: AERs Compatible with Philips TEE Transducers**

Cleaning, Disinfecting, and Sterilizing TEE Transducers by Immersion or AER

Before performing these procedures, read the warnings and cautions in the “Safety” section and “Warnings and Cautions for TEE Transducers” on page 69.

To clean and disinfect or sterilize a TEE transducer, you must use the following procedures:

- “Cleaning the TEE Transducer, Connector, and Handle” on page 80
- “Low-Level Disinfecting TEE Handles and Connectors” on page 81
- “High-Level Disinfecting and Sterilizing TEE Transducers (Flexible Shaft and Distal Tip)” on page 82

Begin by choosing the cleaners and disinfectants or sterilants that are compatible with the different parts of your transducer. Ensure that the solution strength and duration of contact are appropriate for the intended clinical use of the device. Follow the manufacturer's label instructions for preparation and solution strength. If pre-mixed solutions are used, be sure to observe the solution expiration date.

For a list of cleaners, disinfectants, and sterilants that are compatible with your transducer, see *Disinfectants and Cleaning Solutions for Ultrasound Systems and Transducers*, which is available with your system documentation or on the “Transducer and System Care” website:

www.philips.com/transducercare

Cleaning the TEE Transducer, Connector, and Handle

Recommended supplies:

- Non-abrasive sponge
- Compatible cleaners for the transducer, handle, and connector (enzymatic cleaners are recommended)
- Soaking and rinsing trays
- Dry, lint-free cloths

1. In a soaking tray, prepare a cleaner that is compatible with your transducer (flexible shaft and distal tip) to the concentration prescribed by the manufacturer.
2. To clean the transducer, immerse only the flexible shaft and distal tip into the cleaning solution, ensuring that the handle and connector are secure. Immerse only to within 5 cm (2 in) from the strain relief; this is the maximum allowable immersion of the flexible shaft – you are not required to immerse to this point if it is not necessary.

Do not immerse the connector or the handle in the prepared solution. These parts are not waterproof or splash-proof.

Gently clean the transducer using a non-abrasive sponge. Use a gentle wiping or blotting motion to clean the lens.

3. To clean the handle and the connector, use compatible cleaners for each part, and gently wipe them clean. If the transducer cleaning solution is compatible, squeeze the excess fluid out of the sponge and gently wipe the handle and connector.

Do not allow any fluid to enter the handle or steering mechanism, and do not allow any fluid to enter the connector through the electrical contacts, strain reliefs, connector housing, or areas surrounding the locking lever shaft.

4. Allow the transducer, handle, and connector to be exposed to the cleaning solution for the minimum duration recommended by the manufacturer.

5. Wipe the remaining cleaning solution off of the connector and handle using a dry, lint-free cloth.

6. Remove the transducer from the cleaning solution and rinse by immersing in warm water to remove the remaining cleaning solution. Do not rinse the handle or the connector.

7. Check the transducer for any residual organic material. If present, remove it and clean the transducer again.

8. Wipe the transducer dry after rinsing using a dry, lint-free cloth.

The handle and connector are now prepared for low-level disinfection using a low/intermediate-level disinfectant (LLD/ILD). The transducer is ready for high-level disinfection using a high-level disinfectant (HLD), or for sterilization using a sterilant (S).

**Low-Level Disinfecting TEE Handles and Connectors**

Recommended supplies:
- LLD/ILD sprays or pre-saturated wipes that are compatible for the handle and the connector
- Dry, lint-free cloths

1. Wipe the handle and connector using appropriate compatible wipes pre-saturated with approved LLDs/ILDs. If using a spray, spray onto a cloth and then wipe the handle and the connector using the damp cloth. Do not spray disinfectants directly onto either the handle or the connector.

   Do not allow any fluid to enter the handle or steering mechanism, and do not allow any fluid to enter the connector through the electrical contacts, strain reliefs, connector housing, or areas surrounding the locking lever shaft.

2. Follow the manufacturer guidelines for the time required to ensure appropriate levels of disinfection.

3. Use a dry lint-free cloth to wipe the handle and connector to remove the remaining disinfectant.

The handle and connector are now disinfected. Continue with disinfection or sterilization of the transducer.

### High-Level Disinfecting and Sterilizing TEE Transducers (Flexible Shaft and Distal Tip)

Recommended supplies:
- Compatible high-level disinfectant (HLD) or sterilant (S)
- Soaking and rinsing trays or automated endoscope reprocessor (AER)
- Dry, lint-free cloths

**NOTE**

If you use an automated endoscope reprocessor, ensure that the selected protocol includes a rinse cycle and a drying step.
1. Read the label of the HLD or S solution to confirm efficacy and ensure that the solution has not expired.

2. In a soaking tray, prepare the HLD or S solution according to the manufacturer’s instructions. If you are using an AER, prepare the HLD or S solution and program the reprocessor according to the manufacturer’s instructions.

3. Position the transducer in the soaking tub or AER, ensuring that the connector and handle are not at risk of being exposed to the solution during reprocessing. The solutions must not contact the connector and handle during either disinfection or rinsing.

4. Soak or reprocess the transducer for the prescribed length of time.

5. If you soaked the transducer (did not use an AER), in a rinsing tray, rinse the transducer to remove the residual disinfectant or sterilant according to the disinfectant or sterilant manufacturer’s guidelines.

6. Dry the transducer using a sterile, lint-free cloth.

7. Examine the transducer for damage, such as cracks, splitting, fluid leaks, or sharp edges or projections. If damage is evident, discontinue use of the transducer and contact your Philips representative.

8. Store the transducer in a well-ventilated area, with the handle and connector supported and positioned above the transducer. This aids with drying and reduces the risk of residual fluids from the transducer draining into the handle and connector.

The TEE transducer is now disinfected or sterile and is ready to be used.

**Ultrasound Transmission Gels**

For proper transmission of the acoustic beam, use the ultrasound transmission gel supplied by or recommended by Philips, or another glycol-, glycerol-, or water-based acoustic coupling medium.
WARNING
For intraoperative applications, use only the Sterile Aquasonic or Sterile Ultraphonic gel provided with the transducer cover.

CAUTION
Do not use lotion-based products or gels that contain mineral oil. Such products may damage the transducer and void the warranty.

CAUTION
Do not use hand sanitizing gels.

CAUTION
Do not apply the transducer gel until you are ready to perform the procedure. Transducers should not be left soaking in gel.

CAUTION
Gels listed here are recommended because of their chemical compatibility with product materials.

Some recommended gels include:
- Aquasonic 100
- Aquasonic Clear
- Carbogel-ULT
• Scan

For additional compatibility information, call Philips at 800-722-9377 (North America) or your local Philips Ultrasound representative (outside North America).
5 Transducer Storage and Transport

Use the appropriate guidelines for storing transducers for transport, and daily and long-term storage.

Storage for Transport

If a carrying case is provided with your transducer, always use the carrying case to transport the transducer from one site to another. Follow these guidelines to properly store transducers for transport:

- Make sure that the transducer is clean and disinfected before placing it in the case to avoid contaminating the foam that lines the carrying case.
- Place the transducer in the case carefully to prevent kinking of the cable.
- Before closing the lid, make sure no part of the transducer is protruding from the case.
- Wrap the case in plastic material containing sealed-air pockets (such as Bubble Wrap material), and pack the wrapped case in a cardboard carton.
- To avoid damaging the shaft or steering mechanism of TEE transducers, do not bend or coil the flexible shaft of the transducer in less than a 0.3-m (1-ft) diameter circle.

Daily and Long-Term Storage

Follow these guidelines to protect your transducer:

- Always store transducers in the transducer holders on the side of your system or on a securely mounted wall rack when you are not using them.
- Ensure the transducer holders are clean before storing transducers (see the “System Cleaning and Maintenance” section).
- When storing transducers, use the cable-management clips, if available, to secure the transducer cable.
• Avoid storing transducers in areas of temperature extremes or in direct sunlight.
• Store transducers separately from other instruments to avoid inadvertent transducer damage.
• Before storing transducers, make sure they are thoroughly dry.
• For TEE transducers, be sure the distal tip is straight and protected before storing the transducer.
• Never store a TEE transducer in the carrying case, except to transport it.
6 Disinfectants for Systems and Transducers

Read this information before performing disinfection and sterilization procedures. It discusses recommended disinfectants and choosing an appropriate disinfectant for the required level of disinfection. You must refer to the appropriate disinfectants and cleaners compatibility table for the chemical compatibility of disinfectants and cleaners for Philips ultrasound transducers (see Disinfectants and Cleaning Solutions for Ultrasound Systems and Transducers).

About Disinfectants

WARNING
Not all disinfectants are effective against all types of contamination. Ensure that the disinfectant type is appropriate for the specified system or transducer and that the solution strength and duration of contact are appropriate for the intended clinical use.

WARNING
Disinfectants are recommended because of their chemical compatibility with product materials, not their biological effectiveness. For the biological effectiveness of a disinfectant, see the guidelines and recommendations of the disinfectant manufacturer, the U.S. Food and Drug Administration, and the U.S. Centers for Disease Control.

WARNING
If a pre-mixed solution is used, be sure to observe the solution expiration date.
WARNING
Always use protective eyewear and gloves when cleaning, disinfecting, or sterilizing any equipment.

WARNING
The level of disinfection required for a device is dictated by the type of tissue it will contact during use and the type of transducer being used. Ensure that the disinfectant type is appropriate for the type of transducer and the transducer application. For information on the levels of disinfection requirements, see “Transducer Care Methods” on page 31. Also, see the disinfectant label instructions and the recommendations of the Association for Professionals in Infection Control, the U.S. Food and Drug Administration, and the U.S. Centers for Disease Control.

CAUTION
Using non-recommended disinfectants, using incorrect solution strengths, or immersing a transducer deeper or longer than recommended can damage or discolor the transducer and voids the transducer warranty.

CAUTION
On transducers with USB connectors, the only parts that may be cleaned with isopropyl alcohol are the transducer housing and lens (acoustic window). On non-TEE transducers, the only parts that may be cleaned with isopropyl alcohol are the connector housing and the transducer housing and lens. On TEE transducers, the only parts that may be cleaned with isopropyl alcohol are the connector housing and the control housing. Ensure that the solution is only 70% alcohol or less. Do not clean any other part of a transducer with isopropyl alcohol (including cables, USB connectors, or strain reliefs), as it can damage those parts of the transducer. This damage is not covered by the warranty or your service contract.
Factors Affecting Disinfectant Efficacy

The following factors will affect the efficacy of a disinfectant:

- Number and location of microorganisms
- Innate resistance of microorganisms
- Concentration and potency of disinfectants
- Physical and chemical factors
- Organic and inorganic matter
- Duration of exposure
- Biofilms

Choosing Disinfectants and Cleaners

To choose the disinfectant and cleaners that are compatible with your Philips ultrasound system and transducers for your system and transducers, see Disinfectants and Cleaning Solutions for Ultrasound Systems and Transducers, which is available with your system documentation or on the “Transducer and System Care” website:

www.philips.com/transducercare

Follow the label instructions for preparation and solution strength. If a pre-mixed solution is used, be sure to observe the solution expiration date.

Based on material-compatibility testing, product-use profile, and active ingredients, Philips has approved for use the following types of low-level disinfectants used as a spray or wipe for surface (skin contact) and transvaginal or transrectal probes, according to the compatibility restrictions in the disinfectants table:

- Sodium-hypochlorite based (for example 10% household bleach solution with active sodium hypochlorite at approximately 0.6%)
- Quaternary-ammonium (QUAT) based (for example, products that contain n-alkyl xbenzyl ammonium chloride solution where x can be any organic functional group such as ethyl and methyl, and so on; concentration at use should be less than 0.8% total for all QUATs listed)
• Accelerated hydrogen-peroxide based (0.5% hydrogen peroxide maximum)
• Alcohol or alcohol-plus-QUAT based (product alcohol content cannot exceed 70%)
• Products not specifically listed in the compatibility table but with similar active ingredients, as indicated in this list, and marketed for medical use

Because of the large number of available cleaning and disinfection products, it is impossible to have an all-inclusive list. If you are unsure of the suitability of a particular product, please contact your Philips representative for assistance.

For more information:
• www.philips.com/transducercare
• In North America, call Philips at 800-722-9377.
• Outside North America, contact your local Philips representative.
