PHILIPS

REDI Kits

Patient monitoring

Disaster preparedness

Critical care/ICU patient monitoring, anywhere

Health systems in areas experiencing a sharp increase in COVID-19 cases must adapt to new stressors, from staffing issues to shortages of space and equipment. Philips is working to help address these challenges with the **Rapid Equipment Deployment Initiative (REDI) Kit,** which allows a hospital to quickly scale up critical care patient monitoring capabilities.

REDI Kits combine Philips technologies to:

- · Provide accurate patient monitoring data.
- Bring the ICU anywhere a healthcare system needs it, in a matter of days.

80% faster go-live time²

The Philips REDI Kit is a pre-built, pre-configured solution that comes with:

- Sturdy, portable Pelican[™] case.
- Complete step-by-step instructions to enable hospital staff to deploy in just a few hours.

Kits can **ship from our factory quickly,** allowing you to adapt your emergency management capabilities to meet increased patient loads.

Philips provides **remote technical and clinical support** to aid in deployment, allowing hospital staff to focus on what matters most: patient care.

100% customer-centric disaster preparedness solution

We are very excited as the REDI-KIT-Mobile monitors were assembled in short order. We were impressed with the compact packaging of the monitors and since it is ideal for future use in any Emergency Management situation to be able to have the monitors safely and efficiently transported and fully assembled in a short period of time. The staff have all been trained on the monitors and are ready to receive patients in the Mobile Medical Unit. Thank you Philips for your partnership."

Associate Chief of Nursing, Regional Medical Center
